AVERRA

AVERRA — Biomedical Technology

Practical Portfolio

Engineering better movement intelligence.

Course	Entrepreneurship for Engineers (SEC-ENT-301), VJTI Mumbai
Faculty	Krupali Prakashkumar Nakar
Founders	Pranshu Kumar · Pawan Shinde
Products	ParkinSense (wearable wellness and movement intelligence) · TremoSense (assistive active-stabilisation spoon)
Contents	15 mandatory models (M1.1–M5.3), references, evidence appendix, checklists
Submission date	____ / ____ / 2026

This portfolio separates completed evidence from planned work. Pages marked *Awaiting real-world evidence* or *Planned* are honest placeholders, not completed activities.

Contents

Portfolio order follows the course instructions: Module 1 → 5, then references and checklists.

Module 1 – Mindset & Opportunity Discovery

M1.1	Customer-Discovery Evidence Pack	3
M1.2	Opportunity Scorecard & “Why Now?” Memo	5
M1.3	Venture Money-Model & First-Budget Pack	7

Module 2 – Business Model, MVP & First Sale

M2.1	Evidence-Backed Business Model Canvas + Value Proposition Canvas	9
M2.2	MVP Validation Experiment & Decision	11
M2.3	Pricing, Margin & Funnel Performance Pack	12

Module 3 – Operations, Finance & Compliance

M3.1	Operating System & Delivery-Process Blueprint	13
M3.2	Unit-Economics & Runway Model	15
M3.3	Legal-Structure, GST & Compliance Blueprint	17

Module 4 – Scaling: Team, Growth & Fundraising

M4.1	Team & Incentive Blueprint	19
M4.2	Growth-Engine Dashboard	21
M4.3	Fundraising Model, Cap Table & Investor Pitch	22

Module 5 – Venture Launch & Sustainable Enterprise

M5.1	Sustainable & Ethical Enterprise Blueprint	24
M5.2	Live Launch & Iteration Report	25
M5.3	Full Venture Launch & Fundraising Package	26
	References	**28**
	Evidence appendix and pending-evidence checklist	**30**
	Inconsistencies found in the existing AVERRA files	**32**
	Final completeness checklist and submission checklist	**33**

M1 · Activity 1 · Mandatory Model M1.1

Customer-Discovery Evidence Pack

Module 1	**Activity** 1	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Awaiting real-world evidence			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

1. Target customer and problem hypothesis

TremoSense: Adults in urban India living with Parkinson's disease or essential tremor whose hand tremor makes eating difficult, and the family members who help them at meals, regularly lose independence and dignity at mealtimes and currently rely on help from others, adapted cutlery or avoiding certain foods.

ParkinSense: Wearable users, including people living with tremor and their families, want continuous insight into how they move between clinic visits, but today their movement is only observed for a few minutes during a consultation.

2. Mom Test interview questions (past behaviour only)

1. Tell me about the last meal where your (or your family member's) tremor made eating harder. What happened?
2. What did you do about it at that meal? What do you usually do?
3. What have you already tried for eating with tremor (spoons, weighted cutlery, help from someone, changing food)? How did that go?
4. Have you spent money on anything to help with tremor or eating? What was it, roughly how much, and where did you hear about it?
5. How often in the last week did tremor change what or where you ate?
6. When did you last discuss tremor with a neurologist or therapist? What did they measure, and what happened next?
7. Do you currently track symptoms, activity or sleep in any way (watch, app, diary)? Show me the last thing you recorded.
8. Who else is involved when a decision about buying a health device is made in your home?

Rules followed: no pitching before the questions, no "would you buy", no leading questions; record exact words; ask for specifics (last time, how often, how much).

3. Interview evidence log (minimum 5 real interviews)

Pending evidence. AVERRA has not yet run its own customer interviews. The pitch currently quotes published research (Hadley et al. 2021; Kellner et al. 2017; Kurupath et al. 2020), which is secondary evidence, not interviews. Do not present this activity as complete until at least five real interviews are recorded below.

#	Date	Respondent type (no names needed; consent recorded)	Exact words (verbatim)	Pain · frequency · workaround · money/time spent
1				
2				
3				
4				
5				
6				

4. Pattern analysis (complete after interviews)

Signal	Count out of N	Evidence (interview #)
Same pain mentioned		

Signal	Count out of N	Evidence (interview #)
Weekly or more frequent		
Has an existing workaround		
Has already paid money/time/reputation		
Clinician measures movement only in clinic		

5. Secondary evidence already in hand (labelled as published, not interviews)

Who	Published statement	Source
Clinicians	“Obtaining only a snapshot of symptoms during a single clinical office visit does not provide enough time resolution to determine how to optimize symptomatic benefit.”	Hadley, Riley & Heldman, Digital Biomarkers 2021 https://karger.com/dib/article/5/3/206/823097/Real-World-Evidence-for-a-Smartwatch-Based
People with tremor	“I am embarrassed by my tremor when I try to eat or drink in public.”	Most-endorsed item among people with essential tremor; 63.2% found their tremor embarrassing. Kellner et al., J Neurol Sci 2017 https://pmc.ncbi.nlm.nih.gov/articles/PMC5739080
Caregivers (India)	“Out of 100 caregivers, 73 reported to have "severe" caregiver burden.”	Parkinson's caregivers, Southern India. Kurupath, Arathil & Bansal, JCDR 2020 https://jcdr.net/ReadXMLFile.aspx?id=14384

6. Continue / kill decision

Provisional decision: CONTINUE, conditional. Published studies show a real, repeated pain (embarrassment eating in public; only snapshot measurement in clinic; severe caregiver burden in India), and two people with tremor who tried TremoSense informally reacted positively (founder-reported). This is not yet our own interview evidence. **Kill trigger:** if fewer than 3 of 5+ interviewees describe tremor disrupting meals at least weekly, or none has spent money or effort on a workaround, we stop TremoSense as a consumer product.

Final decision line (write after interviews): _____

M1 · Activity 2 · Mandatory Model M1.2

Opportunity Scorecard & “Why Now?” Memo

Module 1	**Activity** 2	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Partially completed			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

1. Bottom-up TAM, SAM and SOM (India, revenue per year)

All inputs are on the *Market* and *Assumptions* sheets of the financial model. Revenue per customer spreads the device price over a 3-year life, net of GST.

Step	TremoSense	ParkinSense (PD households, beachhead)
Population base	Indians aged 60+ = 14.9 Cr (UNFPA 2023)	Same base
Patients	PD 308.9 per lakh aged 60+ → 460,261; ET 89.96 per lakh → 1,276,575	PD aged 60+ = 460,261
Customers with the need	(PD + ET) × 50% eating-disruptive tremor = 868,418	460,261 households
₹ per customer per year	₹9,999 ÷ 1.05 GST ÷ 3 yrs = ₹3,174	₹7,999 ÷ 1.18 ÷ 3 + 40% × ₹169 × 12 = ₹3,069
TAM	**868,418 × ₹3,174 = ₹275.66 Cr**	**460,261 × ₹3,069 = ₹141.26 Cr**
SAM (urban 31.1% × under neurologist care 40%)	**108,031 people = ₹34.29 Cr**	**57,256 = ₹17.57 Cr**
SOM (Year 3, what our channels can reach)	**30 clinics × 4/month × 12 + 50 online/month × 12 = 2,040 = ₹64.76 L** (1.9% of SAM)	**30 clinics × 2/month × 12 + 60 online/month × 12 = 1,440 = ₹44.19 L** (2.5% of SAM)

Company totals: TAM ₹416.92 Cr · SAM ₹51.86 Cr · Year-3 SOM ₹108.95 L. Customer counts are not summed (one household may buy both).

Upside, not in plan totals — ParkinSense as a general wearable: IDC India 2024: 3.5 Cr smartwatches × ₹3,069 = ₹10742 Cr TAM; × 2.8% premium share = SAM ₹300.77 Cr; SOM 0.25% / 0.5% / 1% of SAM buyers = ₹75.19 L / ₹1.50 Cr / ₹3.01 Cr.

> Estimates to state openly: 50% eating-disruptive share, 40% under neurologist care, 3-year device life, 40% subscription take-up, clinic and online volumes. ET prevalence comes from a single rural-Gujarat study. Year-3 SOM is a target, not data.

2. “Why Now?” memo

The shift. Movement sensing on the wrist became mainstream and regulator-accepted, and India created a defined approval route for devices like ours. Dated evidence: Apple opened a Movement Disorder API in ResearchKit (June 2018); Rune Labs' Apple Watch Parkinson's monitoring received FDA clearance (June 2022); licensing became mandatory for all medical devices in India from 1 October 2023; UNFPA projects India's 60+ population to rise from 14.9 Cr to 34.7 Cr by 2050 (September 2023); BMJ projects 25.2 million people with Parkinson's worldwide by 2050 (March 2025). Hardware cost collapsed too: the microcontroller with an on-board 6-axis IMU used in both products lists at US$15.90 (Seeed Studio).

Why it was harder three years ago. Before October 2023 India had no mandatory, clearly defined licensing route for devices like ours, so a product could not be planned and costed end to end, and wrist-based PD monitoring had no regulatory precedent before 2022.

Why the window will not stay open. Global wearable brands (WHOOP, Garmin, Google, Amazfit) already sense movement; if they add tremor features, or imported active spoons (₹35,980–₹58,480 in India today) become cheaper, the low-cost Indian gap closes.

3. 90-second pitch (≈150 words; rehearse aloud, no notes)

> About 4.6 lakh Indians over sixty live with Parkinson's, and more have essential tremor. Their movement is measured for a few minutes in a clinic, and at home a 4–12 hertz tremor turns a spoon into a spill. Published studies say a clinic visit is “only a snapshot”, and people with tremor are most embarrassed eating in public. AVERRA builds two products on one sensing stack. TremoSense is an active stabilising spoon: our current build rejects about 90 percent of tremor on a

> bench simulator, founder-reported. ParkinSense is a ₹7,999 wellness band with tremor detection. Bottom-up, our serviceable market is ₹51.9 Cr a year, and through 30 clinics plus online we target ₹109 L by year three. Next, we run a preregistered user study with at least ten people, and continue only if median tremor reduction reaches 50 percent.

Word count ≈ 150. Timed delivery: _____ s (fill in after practice).

4. Opportunity scorecard (1 = weak, 5 = strong; every score cites its evidence)

Criterion	Score	Evidence behind the score
Size of the problem	4	Bottom-up TAM ₹416.9 Cr; PD and ET prevalence from published studies (Cureus 2025; Mov Disord 2021)
Pain intensity	4	Most-endorsed ET item is embarrassment eating in public (Kellner 2017); 73/100 Indian caregivers report severe burden (JCDR 2020)
Willingness to pay	2	Not yet measured; imported spoons sell at ₹35,980+ and GyroGlove at ≈₹5.6 L, but no AVERRA price test yet
Timing (why now)	4	Dated regulatory and technology shifts 2018–2023 (memo above)
Competition / differentiation	3	No screenless band lists tremor detection; active spoons exist but cost 4–6× our planned price
Team fit	4	Founders built both prototypes; two papers; bench results
Evidence from own customers	1	Own interviews pending (see M1.1)
Total	**22 / 35**	Strong on problem and timing; weakest on own-customer and pricing evidence

M1 · Activity 3 · Mandatory Model M1.3

Venture Money-Model & First-Budget Pack

Module 1	Activity 3	Date completed ___ / ___ / 2026	Venture AVERRA

Evidence status: Partially completed

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. The money model on one page

What we sell	Who pays	How much	How often	Cost to deliver one unit
TremoSense active stabilising spoon (sale; rental option)	Family of the person with tremor, referred by a clinic or OT centre	₹9,999 incl. 5% GST (planned); ₹8,999 from M19; rental ₹799/month	Once per ≈3-year device life	₹4,830 small-batch COGS + 15% clinic margin + 5% warranty + ₹250 shipping → contribution ₹2,538
ParkinSense wellness band + optional insights plan	The user, online	₹7,999 incl. 18% GST + optional ₹199/month	Device once; plan monthly (40% take-up assumed)	₹3,530 COGS + 10% online fees + warranty + shipping → contribution ₹1,982
Research-use (RUO) kits	University labs	₹74,999 per kit	One-off	₹22,650 → contribution ₹40,658

Revenue-model choice, defended: a one-time device sale (with rental for families who cannot pay upfront) fits an assistive product bought once by a family, and keeps every unit profitable from the first sale. A subscription is offered only on ParkinSense, where ongoing insights create ongoing value; it is optional, so it never blocks access.

Brand positioning (Digital Marketing I): For people who want to understand how they move, and for people whose tremor makes eating hard, AVERRA is a biomedical wearables company that turns precise movement sensing into everyday insight (ParkinSense) and active assistance (TremoSense), at prices built for India. **Organic channels:** neurologist and OT referrals, Parkinson's and ET support groups, LinkedIn and YouTube demo videos of the bench rig, the AVERRA website.

2. First three months (M1–M3, Jul–Sep 2027), zero-based from the financial model

Each line is justified from zero (what it buys), not copied forward. Source: Forecast sheet, rows for M1–M3.

One-time costs

Line	M1	M2	M3	3-month total
Industrial design contractor	₹45,000	₹45,000	₹0	₹90,000
Legal, accounting, admin	₹25,000	₹12,000	₹12,000	₹49,000
Patent: attorney + filing fees	₹0	₹55,000	₹0	₹55,000
TremoSense study units (12 × Scenario A cost)	₹0	₹0	₹58,341	₹58,341

Monthly recurring costs

Line	M1	M2	M3	3-month total
Founder stipends (2×₹15k Phase 1 · 2×₹30k M7–24 · 2×₹45k Y3)	₹30,000	₹30,000	₹30,000	₹90,000
Prototyping materials	₹25,000	₹25,000	₹25,000	₹75,000
Tools, cloud, software	₹8,000	₹8,000	₹8,000	₹24,000

	M1	M2	M3	3-month total
Subtotal	₹1,33,000	₹1,75,000	₹1,33,341	₹4,41,341
Contingency 10%	₹13,300	₹17,500	₹13,334	₹44,134
Total 3-month budget	**₹1,46,300**	**₹1,92,500**	**₹1,46,676**	**₹4,85,476**

3. Personal runway (each founder fills in their own; not invented here)

Founder	Personal savings (₹)	Personal monthly expenses (₹)	Personal runway = savings ÷ expenses (months)
Pranshu Kumar			
Pawan Shinde			

Context from the plan: each founder draws a ₹15,000/month stipend in Phase 1 (M1–M6), ₹30,000 in M7–M24 and ₹45,000 in Year 3 (Forecast sheet). Personal runway shows how long each founder can continue if stipends are deferred.

M2 · Activity 1 · Mandatory Model M2.1

Evidence-Backed Business Model Canvas + Value Proposition Canvas

Module 2	Activity 1	Date completed ___ / ___ / 2026	Venture AVERRA

Evidence status: Partially completed

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. Business Model Canvas (all nine blocks)

Block	AVERRA	Evidence-backed or assumption?
Customer segments	Everyday wearable users; households living with Parkinson's or essential tremor; research labs	Assumption (sizes from published prevalence)
Value propositions	ParkinSense: a wearable for everyone with built-in tremor detection. TremoSense: active tremor assistance at an Indian price	Partly evidenced (bench results; no user study)
Channels	Clinic and OT referral; direct online; institutional procurement	Assumption
Customer relationships	Clinic-assisted trial; caregiver onboarding; remote support	Assumption
Revenue streams	TremoSense sale ₹9,999 or rental ₹799/mo; ParkinSense ₹7,999 + optional ₹199/mo; RUO kits ₹74,999	Assumption (prices planned, untested)
Key resources	Sensing and control know-how; two working prototypes; two papers; repositories	Evidence-backed (repos, papers)
Key activities	User studies; CDSCO and ISO 13485; firmware and DSP; small-batch assembly	Evidence-backed for engineering; assumption for regulatory route
Key partners	Neurology clinics; OT centres; university labs; a test lab; a contract assembler; ICMR (clinical evaluation in progress, founder-reported)	Partly evidenced (ICMR founder-reported; no clinic partners yet)
Cost structure	Phase 1 ₹8.76 L: team, study units, user study, IP. Then QMS, EMC, inventory and tooling, outreach	Evidence-backed for component prices (Seeed, servo retailers); rest estimated

2. Value Proposition Canvas

TremoSense — person with tremor and their family

Customer profile	Value map
Jobs: eat independently; eat in public without embarrassment; reduce the help needed at every meal	**Product:** active two-axis stabilising spoon (IMU → EKF → LQR → two servos)
Pains: spills; embarrassment (Kellner 2017); imported active spoons cost ₹35,980–₹58,480; weighted spoons tire the hand	**Pain relievers:** ≈90% tremor rejection on the bench (founder-reported); planned price ₹9,999; built and serviced in India
Gains: dignity; fewer meals needing help; caregiver time back	**Gain creators:** rental option ₹799/month; clinic-assisted trial before buying

ParkinSense — wearable user (including people living with tremor)

Customer profile	Value map
Jobs: understand activity, vitals and movement every day; share a record with a clinician	**Product:** screenless wrist band streaming IMU + PPG over BLE to a dashboard
Pains: clinic sees only a snapshot (Hadley 2021); screenless bands cost ₹12,000–₹25,990 and none lists tremor detection	**Pain relievers:** tremor score, frequency and burden; tremor never counted as steps; ₹7,999 with no mandatory subscription
Gains: long battery; a clear history to discuss with a doctor	**Gain creators:** live dashboard; optional ₹199/month insights plan

3. The three riskiest assumptions and how we test each

#	Riskiest assumption	Why it would sink us	Test (one line)
1	Bench tremor rejection turns into easier eating with real food and real hands	No product without it	Preregistered self-feeding study, n ≥ 10, M6: continue only if median reduction ≥50%
2	Families will pay ₹9,999 (or rent at ₹799/month)	Unit economics fail	In-clinic trial-to-purchase test, 10 clinics, 8 weeks: ≥30% buy at ₹9,999
3	Clinicians will refer patients	Channel and CAC fail	Outreach to 10 neurologists/OT centres: ≥5 agree to host a trial; track referrals per clinic per month

M2 · Activity 2 · Mandatory Model M2.2

MVP Validation Experiment & Decision

Module 2	**Activity** 2	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Planned – protocol ready, not yet run			

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. What exists today (evidence)

MVP	What was run	Result so far	Status
TremoSense current build (Zephyr, 208 Hz, higher-torque servos)	Motorised tremor simulator at 4, 6, 8 Hz, ±5°; 2 people with tremor tried it informally	≈90% tremor rejection on the bench (founder-reported; logs to be published); positive informal feedback, no metric	Bench evidence only
ParkinSense prototype + dashboard	Bench conditions (rest, 5 Hz fixture, walking, arm motion); BLE soak; power profiling	8/8 bench conditions correct; ≈7 mA. Clinical evaluation with ICMR in progress, results pending (founder-reported)	Bench evidence; clinical results pending

No success metric was preregistered before the bench tests above, so they are reported as bench evidence, not as a validated MVP. The experiment below is the first preregistered test and has **not yet been run**.

2. Preregistered experiment (planned for M6)

Item	Protocol
MVP being tested	12 TremoSense study units (Scenario A build)
Target user	Adults with Parkinson's or essential tremor whose tremor disrupts eating; recruited via neurologists/OT centres; ethics approval first
Hypothesis	Using TremoSense reduces tremor amplitude at the spoon head during a standard self-feeding task, and users value it enough to pay ₹9,999
Success metric 1	Median reduction in spoon-head tremor amplitude (IMU) vs a normal spoon, same participant, same task
Success metric 2	Share of participants who say they would pay ₹9,999 (or rent at ₹799/month) after the session
Preregistered thresholds	Persevere: median reduction ≥50% AND ≥60% would pay · Redesign and re-test once: 30–50% · Kill TremoSense: <30% · Pivot to clinic rental: works but <60% would pay
Procedure	Each participant: 10 spoonfuls of a standard food with a normal spoon, then 10 with TremoSense (order randomised); log IMU on handle and head; short interview
Duration and sample	4 weeks in M5–M6; n ≥ 10
ParkinSense pass mark (M10)	Dominant-frequency error ≤5% vs a reference device; zero false steps during tremor

3. Results and decision (fill in only with real results)

Metric	Preregistered threshold	Actual result	Met?
Median tremor reduction	≥50%		
Would pay ₹9,999 / rent	≥60%		
Participants completed	≥10		

Decision (to be written after the test, honouring the threshold even if it hurts): PERSEVERE / REDESIGN / PIVOT / KILL — _____

M2 · Activity 3 · Mandatory Model M2.3

Pricing, Margin & Funnel Performance Pack

Module 2	**Activity** 3	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Partially completed			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

1. Two candidate prices for TremoSense

	Price 1: ₹9,999 (value-based, launch)	Price 2: ₹8,999 (cost-plus after cost reduction)
Rationale	Lowest price with LTV:CAC above 3× at small-batch cost; ≈¼ of the cheapest imported active spoon (₹35,980)	Cost-plus once tooling and supplier quotes bring COGS to ₹2,720 (Scenario C, from M19)
Price ex-GST (÷ 1.05)	₹9,523	₹8,570 at B · ₹8,570 at C
Clinic margin 15%	₹1,428	₹1,286 at B · ₹1,286 at C
Net revenue	₹8,094	₹7,285 at B · ₹7,285 at C
COGS	₹4,830	₹4,830 at B · ₹2,720 at C
Warranty 5%	₹476	₹429 at B · ₹429 at C
Fulfilment	₹250	₹250
Contribution per unit	**₹2,538 (31.4%)**	**₹1,776 (24.4%) at B · ₹3,886 (53.3%) at C**

Contribution margin = selling price − all variable costs of one unit (GST is collected for the government and excluded). Source: Price Matrix and TremoSense Costs sheets. ParkinSense at ₹7,999: net ₹6,101 − COGS ₹3,530 − warranty − shipping = ₹1,982 (32.5%).

2. Funnel (AARRR) — assumed targets, not measured

Stage	Assumed target	Count (per 1,000 reached)	Conversion formula	Measured (fill in)
Reach (Acquisition)	1,000 caregivers via 10 clinics	1,000	—	
Enquiry / trial (Activation)	25% try it in clinic	250	trials ÷ reached	
Purchase (Revenue)	40% of trials buy	100	buyers ÷ trials; overall = buyers ÷ reached = 10%	
Retention	≥70% daily use at day 30	70	active at day 30 ÷ buyers	
Referral	15% refer another family	15	referrers ÷ buyers	

> No real sale or preorder exists yet. Proof of a first sale or credible preorder (receipt, message, payment screenshot) must be attached here when it happens. Until then this part is **awaiting evidence**.

3. Plan to collect real willingness-to-pay evidence

1. During the M6 user study, ask each participant a Van Westendorp price ladder (too cheap / bargain / getting expensive / too expensive) and record exact answers.
2. Offer a refundable ₹1,000 preorder deposit at ₹9,999 to participants and caregivers after the session; count deposits, not compliments.
3. At two clinics, show ₹9,999 and at two others ₹8,999 (A/B by clinic) and record enquiry → trial → deposit conversion.

4. IP note (Legal/IP basics)

Patent: a provisional patent filing is *planned* for M2 (not filed) covering the stabilisation control arrangement. **Trademark:** “AVERRA”, “ParkinSense” and “TremoSense” should be searched and filed (Class 10 medical devices, Class 9 software). **Copyright:** firmware, dashboard code and documentation are protected automatically; record authorship and inventor assignments to the company before any filing.

M3 · Activity 1 · Mandatory Model M3.1

Operating System & Delivery-Process Blueprint

Module 3	**Activity** 1	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Planned – protocol ready, not yet run			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

All times below are **estimates** for a 100-unit pilot batch; none has been measured yet. Measure each step on the first pilot batch and replace the estimate.

1. TremoSense: order to support

#	Step	Owner	Estimated time
1	Clinic/OT referral → in-clinic trial booked	Clinic + AVERRA	1–3 days
2	Trial session and order (sale or rental)	Clinic staff	30 min
3	Pick sub-assemblies from stock	Operations	10 min
4	Final assembly (gimbal, servos, battery)	Contract assembler	40 min
5	**Servo calibration + tremor-rejection test on the simulator rig**	Founders (hardware & test)	**45 min per unit**
6	Safety check, cleaning of food-contact head, packing	Operations	15 min
7	Courier to home or clinic	Courier	2–4 days
8	Onboarding call with caregiver; 7-day check-in	Support	20 min + 10 min

Bottleneck: step 5. One rig and two founders give ≈9 units/day, slower than assembly. **Redesign (no new spend first):** run calibration as a scripted batch on the existing rig (firmware self-test + automatic pass/fail on the logged IMU), test 4 units per rig cycle, and only hand-check failures. Target ≈12 min per unit.

2. ParkinSense: online order to support

#	Step	Estimated time
1	Online order and payment	instant
2	Flash firmware, pair, register device ID	10 min
3	**BLE streaming soak test (packet loss, battery)**	**8 h per batch**
4	Strap fit, pack	10 min
5	Courier	2–4 days
6	App/dashboard onboarding email + support	15 min

Bottleneck: the soak test. **Redesign:** a 20-slot charging-and-soak rack that tests a full batch overnight in parallel.

3. SOP — TremoSense final calibration and test (new hire can follow)

1. Scan the unit's serial QR code; the test script opens a log file named with the serial number.
2. Charge to ≥80% (green LED). If not reached in 60 min, tag “battery” and set aside.
3. Mount the handle in the simulator clamp, spoon head pointing up; tighten until the handle does not slip.
4. Run *self-test*: the servos sweep ±20°; check there is no grinding and both axes return to level.
5. Run the simulator at 4, 6 and 8 Hz for 20 s each; the script computes tremor rejection from the handle and head IMUs.
6. Pass if rejection ≥ the release threshold at every frequency (threshold set from the published bench logs); the script prints PASS/FAIL.
7. On PASS, wipe the food-contact head with food-safe sanitiser, fit the cap and pack with the manual. On FAIL, tag the failure code and send to rework.
8. Upload the log; the order is released for dispatch only when a PASS log exists.

4. Lean wastes and how we remove them

Waste	Where it shows up	How we reduce it
Waiting	Assembled units wait for calibration	Batch self-test script (above); calibrate as units arrive, not at the end
Inventory	Pilot batch of 100 units bought before demand is proven	Buy servos and enclosures in 25-unit lots tied to clinic orders; keep only sub-assemblies
Defects	Servo or boost-converter failures found by the customer	100% end-of-line test with a stored PASS log; track failure codes to fix root causes

M3 · Activity 2 · Mandatory Model M3.2

Unit-Economics & Runway Model

Module 3	**Activity** 2	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Partially completed			

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

Every number is a forecast from the financial model (Unit Economics and Forecast sheets). AVERRA has no actual revenue yet; nothing below is an actual financial result.

1. Unit economics

Metric	Formula	TremoSense	ParkinSense
CAC	planned acquisition spend ÷ customers acquired	₹1,079	₹1,500
Contribution per unit	price ex-GST − channel − COGS − warranty − shipping	₹2,538	₹1,982
LTV	lifetime contribution per customer	₹2,538 × 1.4 purchases (40% repurchase) = ₹3,553	₹1,982 + 40% × ₹129/mo × 20 mo = ₹3,011
LTV : CAC	LTV ÷ CAC	3.29×	2.01×
CAC payback	CAC ÷ contribution per sale	0.43 of the first sale → paid back on the first sale	0.76 of the first sale → first sale

2. 12-month cash forecast (Jul 2027 – Jun 2028), funded by the ₹10.51 L round only

Month	Cash out	Cash in	Net cash flow	Cumulative	Closing cash
M1 · Jul-27	₹1,46,300	₹0	-₹1,46,300	-₹1,46,300	₹9,04,871
M2 · Aug-27	₹1,92,500	₹0	-₹1,92,500	-₹3,38,800	₹7,12,371
M3 · Sep-27	₹1,46,676	₹0	-₹1,46,676	-₹4,85,476	₹5,65,695
M4 · Oct-27	₹1,59,500	₹0	-₹1,59,500	-₹6,44,976	₹4,06,195
M5 · Nov-27	₹1,15,500	₹0	-₹1,15,500	-₹7,60,476	₹2,90,695
M6 · Dec-27	₹1,15,500	₹0	-₹1,15,500	-₹8,75,976	₹1,75,195
M7 · Jan-28	₹2,80,500	₹0	-₹2,80,500	-₹11,56,476	-₹1,05,305
M8 · Feb-28	₹1,87,000	₹0	-₹1,87,000	-₹13,43,476	-₹2,92,305
M9 · Mar-28	₹4,23,500	₹0	-₹4,23,500	-₹17,66,976	-₹7,15,805
M10 · Apr-28	₹4,42,915	₹58,308	-₹3,84,607	-₹21,51,582	-₹11,00,411
M11 · May-28	₹6,68,841	₹0	-₹6,68,841	-₹28,20,423	-₹17,69,252
M12 · Jun-28	₹2,77,915	₹1,68,833	-₹1,09,082	-₹29,29,505	-₹18,78,334

Closing cash = ₹10.51 L raised − cumulative net outflow (Funding Scenarios sheet, Scenario C: Round 1 only, no grant). Negative closing cash means tranche 2 must already have closed.

3. Burn, runway and zero-cash date

- Phase-1 burn (M1–M6) = ₹8,75,976 ÷ 6 = **₹1,45,996/month** (no cash in).
- Year-1 gross burn = ₹31,56,646 ÷ 12 = **₹2,63,054/month**; net burn after ₹2,27,141 cash in = **₹2,44,125/month**.
- Runway on this round = ₹10,51,171 ÷ ₹1,45,996 = **7.2 months** at Phase-1 burn.
- **Projected zero-cash date: January 2028 (M7)**, when Phase-2 spending starts. Tranche 2 (₹37.71 L) must close by then; if it is late, hiring, inventory and testing pause and the buffer stretches to about M14.

4. Bad-growth scenario (toggle: price cut to grow faster)

Year-2 TremoSense	Normal plan	Bad growth
Price	₹9,999	₹5,999 (discount to chase volume)
Units sold	695	1,390 (twice the volume)

Year-2 TremoSense	Normal plan	Bad growth
Contribution per unit (Scenario B cost)	₹2,538	-₹510
CAC per customer	₹1,079	₹1,079
Contribution − CAC per customer	₹1,459	-₹1,589
Total effect on cash	**₹10,14,005**	**-₹22,08,710**

In the bad-growth case every extra customer loses ₹1,589, so doubling volume deepens the loss by ₹32.23 L versus the plan and pulls the zero-cash date earlier. This is why the plan holds ₹9,999 until a verified cost reduction (Scenario C) makes ₹8,999 profitable. (Illustrative toggle built from the model's Price Matrix; not a separate sheet in the workbook.)

M3 · Activity 3 · Mandatory Model M3.3

Legal-Structure, GST & Compliance Blueprint

Module 3	**Activity** 3	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Partially completed			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

Educational blueprint, not legal or tax advice. GST rates and HSN codes for TremoSense (assumed 5%) and ParkinSense (assumed 18%) must be confirmed with a chartered accountant.

1. Structure comparison for AVERRA

	Proprietorship	Partnership	LLP	Private Limited
Liability	Unlimited, personal	Unlimited, joint	Limited	Limited
Paperwork	Lowest	Low (deed)	Moderate (annual LLP filings)	Highest (ROC filings, audit, board meetings)
Raising equity	Not possible	Not practical	No equity shares; VCs rarely invest	Equity shares, SAFEs/CCPS, ESOPs; standard for investors
DPIIT / Startup India / SISFS	No	Registered firms eligible	Eligible	Eligible
Fit for a two-founder medical-device startup	No	No	Partial	**Best fit**

Recommendation: Private Limited. We plan to raise equity in two tranches and grant ESOPs, which needs shares; limited liability matters for a device used on the body; and DPIIT recognition plus the Startup India Seed Fund application (applied for, not secured) require a recognised entity.

2. Mock GST calculation (hypothetical example, per unit)

	TremoSense @ ₹9,999 (5% assumed)	ParkinSense @ ₹7,999 (18% assumed)
Output GST charged to customer	₹9,999 − ₹9,999/1.05 = ₹476	₹7,999 − ₹7,999/1.18 = ₹1,220
Input tax credit on purchases (18% on bought-in parts)	(COGS ₹4,830 − labour/QC ₹600) × 18% = ₹761	COGS ₹3,530 × 18% = ₹635
Net GST payable	**-₹285** → credit (inverted duty: input rate > output rate; refund can be claimed under Sec 54(3), CGST Act)	**₹585** payable
For 100 units	-₹28,526	₹58,479

3. First-year compliance calendar (to confirm with a CA/CS)

When	Filing / task
Before M1	Incorporate Pvt Ltd (SPICe+), PAN/TAN, bank account; founders' agreement and inventor assignments
Within 30 days	Appoint first auditor (ADT-1); first board meeting
Within 180 days	Commencement of business (INC-20A)
On turnover/inter-state supply	GST registration; then GSTR-1 (11th) and GSTR-3B (20th) monthly, or QRMP quarterly
Quarterly	TDS returns; board meeting (at least 4 a year)
M2	Provisional patent filing (planned); trademark applications
M4	CDSCO classification opinion; ethics committee approval for the user study
M9–M10	CDSCO registration/licence application for TremoSense (class to be confirmed)
30 Sep	DIR-3 KYC for directors; AGM within six months of year end

When	Filing / task
31 Oct / Nov	ITR-6; AOC-4 and MGT-7 annual ROC filings
Any time	DPIIT Startup recognition; Startup India Seed Fund application (applied for, not secured)

4. Founder-agreement clauses (proposed)

1. **Equity and vesting:** founder shares vest over 4 years with a 1-year cliff; unvested shares return to the company on departure.
2. **Roles:** Pranshu — CEO, wearable hardware and firmware; Pawan — control, gimbal and power electronics. Both remain the hardware and test engineers.
3. **Decision-making:** day-to-day decisions by the role owner; fundraising, new products, hiring above ₹30,000/month and any medical claim need both founders.
4. **Departure:** good-leaver keeps vested shares; bad-leaver (fraud, breach) sells vested shares back at face value; 3-month notice and handover.
5. **IP assignment:** all IP created for AVERRA (including pre-incorporation prototypes) is assigned to the company before any patent filing.

M4 · Activity 1 · Mandatory Model M4.1

Team & Incentive Blueprint

Module 4	Activity 1	Date completed ___ / ___ / 2026	Venture AVERRA

Evidence status: Partially completed

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. 12-month org chart and hiring sequence

Month	Team	Why then
M1–M6	Pranshu Kumar (CEO, wearable hardware & firmware) · Pawan Shinde (control, gimbal & power) — both hardware and test engineers	Phase 1 is engineering and validation; no hires
M7–M12	Founders + contract support (regulatory consultant, industrial designer, contract assembler)	Regulatory filing and pilot batch; contracts, not payroll
M19	+ Clinic-network sales lead · + Customer support & operations	After first sales prove demand
M25	+ App & firmware engineer (ParkinSense)	ParkinSense wellness launch

The plan's first hires fall after month 12, so the 12-month chart is the two founders plus contractors (Forecast sheet hiring lines).

2. Role descriptions

Role	Responsibilities	What good looks like
Clinic-network sales lead (M19)	Sign and support neurology and OT clinics; run in-clinic trials; manage clinic margin terms	30 active clinics by M30; ≥4 TremoSense sales per clinic per month; CAC ≤ ₹1,079
Customer support & operations (M19)	Onboarding calls, 7-day check-ins, returns, dispatch, stock	Onboarding within 48 h; ≥70% daily use at day 30; return rate <5%
App & firmware engineer (M25)	ParkinSense mobile app, BLE firmware, cloud sync	App store release by M27; crash-free sessions ≥99%; no data-privacy incidents

3. Structured mock-interview guide (same questions for every candidate)

1. Tell me about a time you got a clinician or institution to adopt something new. What exactly did you do?
2. Walk me through how you tracked a sales pipeline last time. What numbers did you watch?
3. Describe a deal you lost. What did you learn?
4. A caregiver says the device isn't helping after a week. What do you do in the first call?
5. Score: 1–5 on evidence of past behaviour, clarity, customer empathy, numeracy.

Interviewer (classmate)	Date	Q1	Q2	Q3	Q4	Total /20	Notes

Mock interview record pending; complete it with a classmate and attach notes.

4. Founder equity-split method (scores to be agreed by the founders)

Factor (weight)	Pranshu (1–10)	Pawan (1–10)	How to score
Idea and IP (25%)			Who originated each product and holds the prototypes and papers
Capital contributed (15%)			Cash and equipment put in
Full-time commitment (35%)			Months committed full-time from M1
Prior expertise (25%)			Relevance of skills to the next 18 months

Founder share = Σ(weight × score) for that founder ÷ Σ(weight × score) for both founders × 82.71% (founders' total after Round 1 with a 5% ESOP pool; Funding Scenarios sheet). *Illustrative only:* if both founders score equally, each holds 50% of founder equity = 41.36% after Round 1. Vesting: 4 years, 1-year cliff, monthly thereafter.

5. ESOP pool and a sample grant

The model reserves a **5% ESOP pool**, enough for the three planned hires (≈1–1.5% each) plus a reserve. The course suggests 10–15%; we keep 5% now to limit dilution in a small round and plan to top it up at tranche 2 when the team grows (flagged for the founders to decide).

Sample grant: 0.5% × post-money ₹85,51,171 = **₹42,756** on paper at the proposed valuation (illustrative; not a market value).

M4 · Activity 2 · Mandatory Model M4.2

Growth-Engine Dashboard

Module 4	**Activity** 2	**Date completed** ___ / ___ / 2026	**Venture** AVERRA

Evidence status: Planned – protocol ready, not yet run

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

> No paid campaign or structured organic experiment has been run yet, so there are no reach, click, CAC, ROAS or retention figures to report. The tables are ready to complete; nothing below is measured.

1. Campaign tracker (fill in after running one campaign or organic push)

Channel	Spend ₹	Reach	Clicks	Enquiries	Conversions	CAC = spend ÷ conversions	ROAS = revenue ÷ spend

Suggested first test: a ₹2,000 Instagram/YouTube boost of the TremoSense bench video to caregivers in Mumbai and Pune, linking to a preorder-deposit form; count deposits as conversions.

2. Cohort retention (fill in from real users)

Cohort (joined)	Users	Active Month 1	Active Month 2	Active Month 3

3. Growth experiment backlog, ICE-scored (scores are the founders' current judgement)

Experiment	Pass mark	Impact	Confidence	Ease	ICE total	Rank
In-clinic trial → purchase (10 clinics, 8 weeks)	≥30% buy at ₹9,999; CAC ≤ ₹1,079	9	5	5	19	1
ParkinSense wellness beta (100 users, 8 weeks)	≥40% weekly active; ≥25% would subscribe	7	5	6	18	2
Support-group referrals (PD/ET caregiver groups)	≥15% refer; CAC ≤ ₹800	6	4	7	17	3

ICE total = Impact + Confidence + Ease (each 1–10). Rank 1 runs first because it tests the riskiest commercial assumption (willingness to pay through clinics).

M4 · Activity 3 · Mandatory Model M4.3

Fundraising Model, Cap Table & Investor Pitch

Module 4	**Activity** 3	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Partially completed			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

1. The ask and the milestone it funds

Raise **₹10,51,171** (Round 1) to fund Milestone 1 (M1–M6): both founders full-time, 12 study units, the preregistered user study, a provisional patent filing (planned) and a CDSCO classification opinion. Amount = Phase-1 peak cash gap ₹8,75,976 × 1.2 buffer.

2. Valuation

Proposed pre-money: ₹75,00,000 — a working negotiation target, not an independently verified market valuation. Methods used, named explicitly:

- **Cost-to-duplicate (floor):** 34 person-months × ₹1,25,000 + ₹2,25,000 materials = ₹44,75,000.
- **Berkus-style scorecard (cross-check):** ₹15.0 L + ₹20.0 L + ₹12.5 L + ₹10.0 L + ₹2.5 L = ₹60,00,000.
- The premium above the cross-check reflects two products and a clinical evaluation in progress (founder-reported).

3. Arithmetic

	Formula	Value
Post-money	Pre-money + investment	₹75,00,000 + ₹10,51,171 = **₹85,51,171**
Investor ownership	Investment ÷ post-money × 100	₹10,51,171 ÷ ₹85,51,171 = **12.29%**
ESOP pool	set aside	**5%**
Founders	100% − investor − ESOP	**82.71%**

4. Cap table

Holder	Before Round 1	After Round 1 (at ₹75 L pre)
Founders	100%	82.71%
ESOP pool	—	5.00%
Round-1 investor	—	12.29%
Total	100%	100%

The model treats the 5% ESOP pool as created at Round 1 alongside the investor (founders = 100% − 12.29% − 5%). Check: 82.71% + 5.00% + 12.29% = 100.00%.

5. Use of funds (Phase 1, M1–M6)

Category	Amount	Share	What it buys
Team	₹2,70,000	31%	Both founders full-time for six months
Validation (both products)	₹1,58,341	18%	12 TremoSense study units and the user study (n ≥ 10); ParkinSense reference testing
Regulatory & quality	₹30,000	3%	CDSCO classification opinion and ethics approval
Prototyping, tools, IP	₹2,53,000	29%	Provisional patent, test equipment and prototype iterations
Go-to-market & admin	₹85,000	10%	Clinic outreach for the trial-to-purchase test; company admin
Contingency	₹79,634	9%	Buffer for slips and price changes
Total Phase 1	**₹8,75,976**	100%	Round = this × 1.2 = ₹10,51,171

Runway: 7.2 months at Phase-1 burn. **After this round:** tranche 2 of ₹37.71 L must close by M7 (Jan 2028), priced on the M6 result; total to break-even ₹48.22 L. **Startup India Seed Fund grant (₹20 L): applied for, not secured, and not**

counted.

6. Short investor pitch

> AVERRA engineers better movement intelligence. TremoSense is an active stabilising spoon that rejects about 90% of tremor on our bench, founder-reported, at ₹9,999, a quarter of imported alternatives; ParkinSense is a ₹7,999 wellness band with tremor detection, in a clinical evaluation with ICMR. Every unit is profitable from the first sale: ₹2,538 contribution on TremoSense. We are raising ₹10.51 L at a ₹75 L pre-money for 12.3% to reach one clear answer in six months: a preregistered user study with at least ten people. If the median tremor reduction is below 30%, we stop TremoSense.

Mock-panel pitch date: _____ · Panel questions and our answers: _____ (fill in after the class pitch).

M5 · Activity 1 · Mandatory Model M5.1

Sustainable & Ethical Enterprise Blueprint

Module 5	**Activity** 1	**Date completed** ___ / ___ / 2026	**Venture** AVERRA

Evidence status: Partially completed

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. Stakeholders beyond customers and investors

Stakeholder	How AVERRA affects them	Our commitment
Caregivers and families	Time and stress at meals; they often pay	Honest claims; rental option; clear return policy
Clinicians and OT therapists	Referrals carry their reputation	Share study results, including negative ones; no referral kickbacks
Employees and contractors	Assembly and test work, data access	Fair pay; safety training for battery handling; data-access controls
Suppliers and contract assembler	Volume, payment terms	Pay within 30 days; no forced price cuts after orders
Environment	LiPo batteries, electronics, plastic	Take-back and refurbishment programme; RoHS-compliant parts
Community / research participants	Study participants' health data	Ethics approval, informed consent, data minimisation

2. One specific ESG improvement

Device take-back and refurbishment (environmental + social). Every TremoSense and ParkinSense comes with a prepaid return label at end of life or after a rental ends. Returned units are tested on the same calibration rig, refurbished and re-rented at a lower rate to families who cannot afford ₹9,999; LiPo cells and e-waste go to an authorised recycler under India's E-Waste (Management) Rules 2022. Target: ≥50% of rental units refurbished at least once.

3. Ethical red lines and scenario tests

Red line	Tempting, realistic scenario	What we do
We will never claim ParkinSense diagnoses or predicts Parkinson's until clinical results support it	A marketing partner says “early Parkinson's detection” would triple sign-ups	Refuse. Market it as a wellness band with tremor insight; add clinical claims only after ICMR results and regulatory approval
We will never sell or share identifiable health or movement data	An insurer offers ₹10 L a year for anonymised tremor data	Decline unless users give explicit, separate opt-in consent and the data is genuinely de-identified under India's DPDP Act 2023
We will never hide or reword a failed validation result	The M6 study shows 35% reduction, below our 50% target, just before tranche 2	Report the result as preregistered, follow the redesign rule, and tell investors before they decide

4. Responsibilities specific to biomedical wearables and assistive technology

- **Data privacy:** minimal data collection; on-device or encrypted transfer; deletion on request (DPDP Act 2023).
- **Accessibility:** large controls, no small screens to read, caregiver-friendly onboarding, regional-language manuals, rental for affordability.
- **Truthful claims:** “≈90% on a bench simulator (founder-reported)” is never shortened to “90% less tremor”.
- **Unvalidated features:** HR/HRV/SpO_2 are labelled research-grade until validated against reference devices.

M5 · Activity 2 · Mandatory Model M5.2

Live Launch & Iteration Report

Module 5	**Activity** 2	**Date completed** ___ / ___ / 2026	**Venture** AVERRA
Evidence status: Awaiting real-world evidence			
AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.			

Incomplete. AVERRA has not run a launch or pilot launch. Two people with tremor have tried TremoSense informally (founder-reported, no recorded metric). This sheet therefore holds the launch plan and the evidence template; it must not be presented as a completed launch.

1. Pilot-launch plan

Item	Plan
What	In-clinic TremoSense pilot using the 12 study units after ethics approval (M5–M6)
Who	≥10 adults with tremor and their caregivers, via 2–3 neurology/OT clinics
How long	4 weeks
Feedback channels	Session interview, 7-day WhatsApp check-in, short exit questionnaire
Decision rule	Same preregistered thresholds as M2.2

2. Evidence template (complete with real feedback only)

#	Date	User type	Exact feedback (verbatim)	Theme
1				
2				
3				
4				
5				

Recurring theme	How many users	Change we made	What happened after

3. Crisis and contingency plan

Risk	Likelihood	Impact	Response
A servo or battery failure during a meal (spill, burn risk from food, or overheating)	Medium during the pilot	High (user safety, clinic trust)	Mechanical end-stops limit head travel; thermal cut-off in firmware; supervised first use; stop-use notice and replacement within 48 h; incident log reviewed with the clinic; pause the pilot if two incidents occur
Tranche 2 closes late	Medium	High (zero-cash M7)	Pause hiring, inventory and testing; defer stipends; buffer lasts to ≈M14

4. Continue / kill call

Not yet decidable on market evidence. Current call: continue to the preregistered pilot. Final call (after the pilot): _____

M5 · Activity 3 · Mandatory Model M5.3

Full Venture Launch & Fundraising Package

Module 5	Activity 3	Date completed ___ / ___ / 2026	Venture AVERRA
Evidence status: Partially completed			

AI assistance: AI (Claude) helped structure and draft this sheet from the founders' own pitch deck, financial model and repositories. The founders must verify every source, supply the real-world evidence marked pending, and approve all conclusions.

1. Package contents

Component	Where	Status
Pitch deck (17 slides)	deck/AVERRA_Pitch.pptx and averraproject.vercel.app	Done
Financial model	model/AVERRA_Financial_Model.xlsx	Done (forecast, not actuals)
Cap table and fundraising model	M4.3; Funding Scenarios sheet	Done
Customer evidence	M1.1	Pending (own interviews)
MVP validation	M2.2	Planned (bench evidence only)
Launch evidence	M5.2	Pending

2. Why this could fail (single biggest, specific risk)

Bench rejection may not turn into easier eating. Real food, real spoons and tired hands are harder than a motorised simulator.

Stop or change direction if: the M6 study (n ≥ 10) shows median tremor reduction below 30% → stop TremoSense and focus on ParkinSense; 30–50% → one redesign and re-test; it works but fewer than 60% would pay → pivot to clinic rental at ₹799/month; tranche 2 does not close by M7 → pause spending and extend to ≈M14 on the buffer.

3. Investment memo

Company. AVERRA, biomedical technology. “Engineering better movement intelligence.” Founders: Pranshu Kumar and Pawan Shinde (both hardware and test engineers).

Problem. About 4.6 lakh Indians aged 60+ live with Parkinson's and ≈12.8 lakh have essential tremor (single-study estimate). Movement is measured only in short clinic visits, and tremor makes eating hard and embarrassing (published studies; own interviews pending).

Products and status. TremoSense, an active stabilising spoon: ≈90% tremor rejection on a bench simulator (founder-reported; logs to be published); 2 informal user trials. ParkinSense, a ₹7,999 screenless wellness band with tremor detection: steps, tremor and rest-vs-movement bench-tested; heart metrics need validation; clinical evaluation with ICMR in progress, results pending. No diagnostic claims.

Market. Bottom-up TAM ₹416.9 Cr, SAM ₹51.9 Cr, Year-3 SOM ₹109.0 L; general-wearable upside shown separately.

Business model and unit economics. Clinic-referred device sales and rental; ParkinSense online with an optional plan; RUO kits for labs. TremoSense contribution ₹2,538 (31.4%) at ₹9,999; LTV:CAC 3.3×; CAC paid back on the first sale.

Financials (forecast). Year-1 costs ₹31.57 L; break-even M23 · May-29; Year-3 operating profit ₹18.93 L on ₹2.12 Cr cash in; total to break-even ₹48.22 L.

The ask. ₹10,51,171 at a proposed ₹75,00,000 pre-money (negotiation target; cost-to-duplicate floor ₹44.75 L, Berkus cross-check ₹60 L) = 12.29% to the investor; founders 82.71% after a 5% ESOP pool. Funds Milestone 1: the preregistered user study by M6. Tranche 2 ₹37.71 L by M7. Startup India grant applied for, not secured.

Key risk and kill rule. Bench results may not transfer to real meals; stop TremoSense below 30% median reduction.

4. Personal entrepreneurial thesis (each founder writes their own; not drafted for you)

Question	Your answer, with evidence from your own semester work
Would you START, OPERATE, FUND or JOIN a venture? Pick one.	
What evidence from your M1–M5 work supports that choice? (name the activity and the number or quote)	
What did the customer-discovery and validation work change in your thinking?	
What would make you change this answer?	

References

Prices and figures were checked on the dates stated in each label (most competitor prices on 16 Oct 2026; FX on 12 Oct 2026). Accessed for this portfolio: 16 Oct 2026. Founders should re-open every link before submission.

Evidence appendix

Evidence status of all 15 models

Model	Title	Status
M1.1	Customer-Discovery Evidence Pack	Awaiting real-world evidence
M1.2	Opportunity Scorecard & “Why Now?” Memo	Partially completed
M1.3	Venture Money-Model & First-Budget Pack	Partially completed
M2.1	Evidence-Backed Business Model Canvas + Value Proposition Canvas	Partially completed
M2.2	MVP Validation Experiment & Decision	Planned – protocol ready, not yet run
M2.3	Pricing, Margin & Funnel Performance Pack	Partially completed
M3.1	Operating System & Delivery-Process Blueprint	Planned – protocol ready, not yet run
M3.2	Unit-Economics & Runway Model	Partially completed
M3.3	Legal-Structure, GST & Compliance Blueprint	Partially completed
M4.1	Team & Incentive Blueprint	Partially completed
M4.2	Growth-Engine Dashboard	Planned – protocol ready, not yet run
M4.3	Fundraising Model, Cap Table & Investor Pitch	Partially completed
M5.1	Sustainable & Ethical Enterprise Blueprint	Partially completed
M5.2	Live Launch & Iteration Report	Awaiting real-world evidence
M5.3	Full Venture Launch & Fundraising Package	Partially completed

Evidence already in hand

- Two working prototypes and repositories (ParkinSense develop branch; TremoSense project).
- Bench results: ParkinSense 8/8 bench conditions, ≈7 mA; TremoSense ≈90% bench rejection (founder-reported, logs to be published).
- Dated, sourced market and competitor figures (References).
- Financial model with live formulas (11 sheets).
- ParkinSense dashboard screenshot reading tremor at 4.88 Hz (pitch website).

Pending-evidence checklist

Model	Missing evidence	How to collect it	Done
M1.1	Five or more real customer interviews with verbatim answers and dates	Interview PD/ET patients and caregivers via clinics or support groups; record consent	☐
M1.2	Timed delivery of the 90-second pitch	Rehearse and record the time	☐
M1.3	Each founder's personal savings and monthly expenses	Fill in privately	☐
M2.2	Preregistered user-study results (n ≥ 10)	Run after ethics approval; compare with thresholds	☐
M2.2	Published TremoSense bench logs and tuned constants (≈90% figure)	Publish logs in the repository	☐
M2.3	Real price-test responses; first sale or preorder proof	Van Westendorp + refundable deposit	☐
M3.1	Measured step times on the first batch	Time each step on the pilot	☐
M3.3	CA confirmation of HSN codes and GST rates	Consult a chartered accountant	☐
M4.1	Agreed founder scores; mock-interview record	Founders' meeting; classmate interview	☐
M4.2	Campaign reach/clicks/CAC/ROAS; cohort retention	Run one small campaign; track users	☐
M4.3	Mock-panel pitch date and questions	Record after the class pitch	☐
M5.2	Pilot launch, real feedback, one change and its effect	Run the in-clinic pilot	☐
M5.3	Personal entrepreneurial thesis	Each founder writes their own	☐

Model	Missing evidence	How to collect it	Done
All	ICMR clinical-evaluation results (ParkinSense)	Add when published; no clinical claim until then	☐
All	Patent filing receipt (currently planned, not filed)	File the provisional and attach the receipt	☐

Inconsistencies found in the existing AVERRA files

Reported, not silently changed. The deck and workbook were not modified for this portfolio.

#	Issue	Where	What to resolve
1	The course asks for a 10–14 slide pitch; the current deck and website have 17 slides	deck/AVERRA_Pitch.pptx, website	Merge Why now into Problem, move Architecture to backup, and fold Competitive advantage into the close for a 14-slide timed version
2	Required Problem slide asks for quotes from own interviews; the deck uses published research quotes	Problem slide	Replace or add quotes after M1.1 interviews
3	ESOP pool is 5%; the course example suggests 10–15%	Funding Scenarios sheet	Founders to confirm 5% now with a top-up at tranche 2, or resize and re-run ownership
4	Milestone list places M25 (ParkinSense launch) before M23 (break-even)	content milestones / website timeline	Reorder chronologically
5	README still describes older items (TremoSense “not yet tested with users”; older competitor set; patent “in preparation”)	README.md	Update to: 2 informal users; WHOOP/Garmin Cirqa/Fitbit Air/Helio Strap; provisional filing planned
6	Advantage note dated 12 Oct 2026 while competitor prices were re-checked 16 Oct 2026	content advantage note (now corrected in source to 16 Oct)	Rebuild website/deck once to pick up the corrected note
7	Bad-growth scenario is computed in this portfolio from the Price Matrix but is not a toggle in the workbook	Financial model	Optionally add a bad-growth toggle sheet

Final completeness checklist

Check	Result
All 15 mandatory models present, labelled M1.1–M5.3, in module order	Yes
Each sheet has module, activity, title, date field, AI disclosure and evidence status	Yes
Figures cross-checked against the workbook (export of 16 Oct 2026)	Yes — generated directly from the model
Funding ask, valuation, ownership and ESOP	₹10,51,171; ₹75 L pre (negotiation target); post ₹85,51,171; investor 12.29%; ESOP 5%; founders 82.71%
Grant described as secured anywhere?	No — applied for, not secured
Patent or clinical claims presented as fact?	No — patent filing planned; ICMR results pending
Interviews, sales, campaign data or launch results invented?	No — templates provided and flagged
Missing evidence flagged	Yes — see pending-evidence checklist

Submission checklist (physical copy)

1. Print single-sided on A4, colour if possible (status labels are colour-coded but also written in words).
2. Fill every date field and sign/initial each sheet.
3. Complete the pending items you have evidence for; leave the rest visibly marked pending.
4. Attach evidence behind the matching sheet: interview notes, price-test responses, receipts/preorder proof, campaign screenshots, mock-interview notes.
5. Order: cover → contents → M1.1 … M5.3 → references → evidence appendix → inconsistencies → this checklist.
6. Bind with a clear cover; add tabs for Modules 1–5 so pages can be opened quickly in the viva.
7. Bring the deck on a USB drive and the website link as backup.
8. Before the viva, re-read M1.2 (TAM/SAM/SOM), M3.2 (runway, zero-cash date) and M4.3 (valuation arithmetic).
